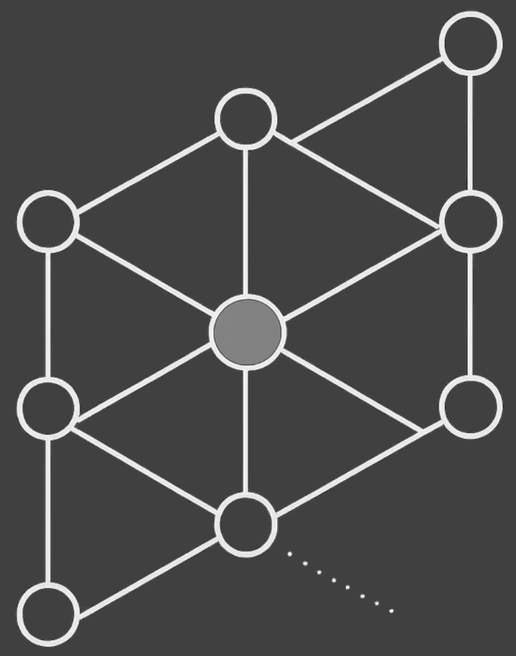
IndexFlow



Perp-Driven Basket Vaults

Infrastructure for Measurable Liquidity Growth

A chain-agnostic liquidity pilot programme that converts targeted, ring-fenced capital into measurable, chain-local TVL, trading volume, and fee generation.

This is NOT a treasury subsidy — it is a **controlled infrastructure deployment** that lets a chain buy growth with full attribution.

Made with GAMMA

The Problem for Chains

Short-Lived TVL Spikes

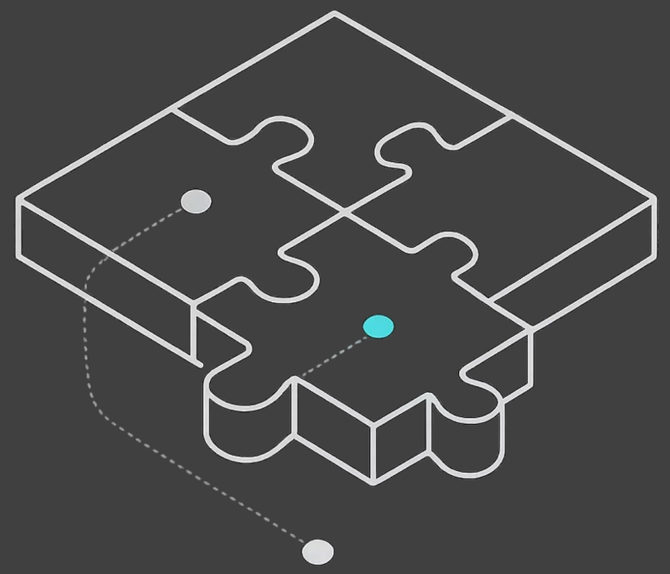
Liquidity incentives attract mercenary capital that exits as soon as rewards dry up, leaving no durable ecosystem value.

No Attribution Layer

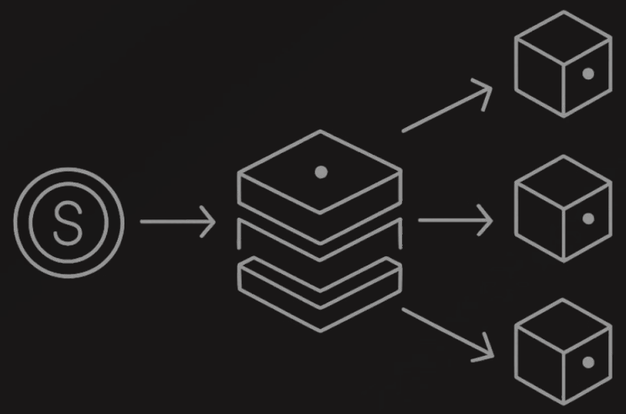
Grant programmes lack causal links between funding and sustained on-chain activity — volume, fees, and retention remain unmeasured.

Fragmented Capital Efficiency

Dispersed deployments dilute impact. Capital is spread thin, making it impossible to attribute outcomes to any single initiative.



What This Protocol Is



A vault system powered by a shared perpetual liquidity layer

Vaults allocate capital into a **shared perp liquidity pool**, with per-vault PnL tracked.

Designed for composable, multi-asset structured exposure to **any asset** with reliable/auditable price streams.

Made with GAMMA

Build vaults, get audited, share liquidity

Indexflow is built for managers who need more than a token wrapper.
It is infrastructure for launching structured vaults with custom logic, custom reserves, and product-specific liquidity.

Capabilities

Custom return schedules

Define how returns are distributed, accrued, or paid out over time.

Custom oracles

Use specialized reference data instead of standard price feeds.

Domain-specific logic

Embed asset-specific rules, constraints, and underwriting logic.

Ring-fenced liquidity per vault

Isolate liquidity at the vault level so risk and reserves stay product-specific.

Complex strategies

Support structured exposure and non-standard payoff designs with custom smart contracts.

Who It's For

- Fintech / Existing asset managers
- (Institutional) issuers of structured products
- Real-world asset operators
- Off-chain reserve asset custodians
- Teams looking to tokenise exposure to their assets without regulatory heavy lifting

Made with GAMMA

How does it work

Deposit USDC

Receive Vault Token

Allocate to Perps

Track PnL via Oracles

Redeem from Idle USDC

Shares reflect the full NAV — idle USDC, allocated capital, and accumulated PnL. Redemptions are fulfilled from idle reserves, creating a clear distinction between **NAV** and **redeemable liquidity** — the central mechanic that drives chain value.

Made with GAMMA

The Liquidity Bottleneck

Redemption liquidity is the system bottleneck

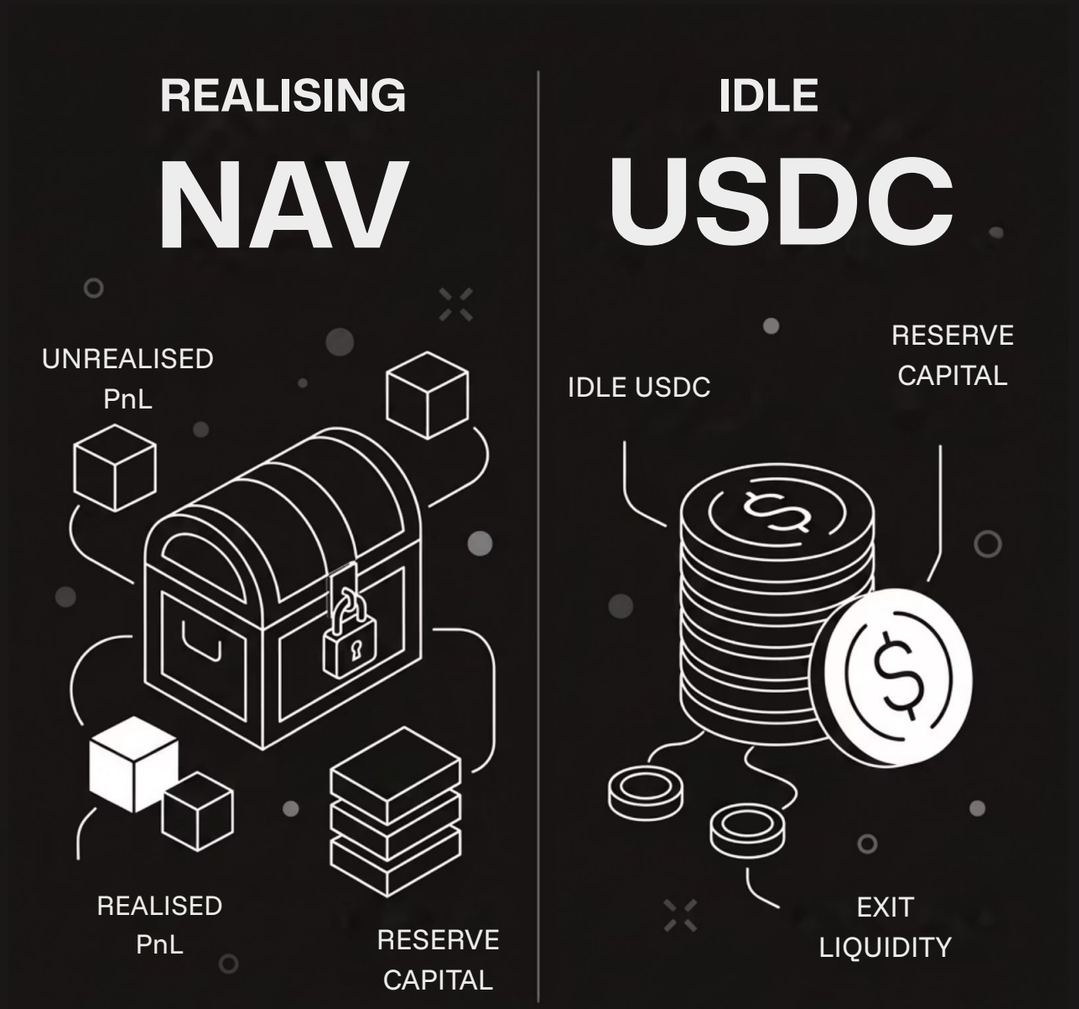
Capital allocated to perp positions is not instantly redeemable. Redemptions depend entirely on idle USDC reserves. High NAV without sufficient reserves erodes user confidence and constraints throughput.

Liquidity depth directly determines:

Redemption reliability — user trust in the system

Trading capacity — size and frequency of perp positions

Capital velocity — how fast capital cycles through the protocol



Made with GAMMA

Why This Is Valuable for Chains

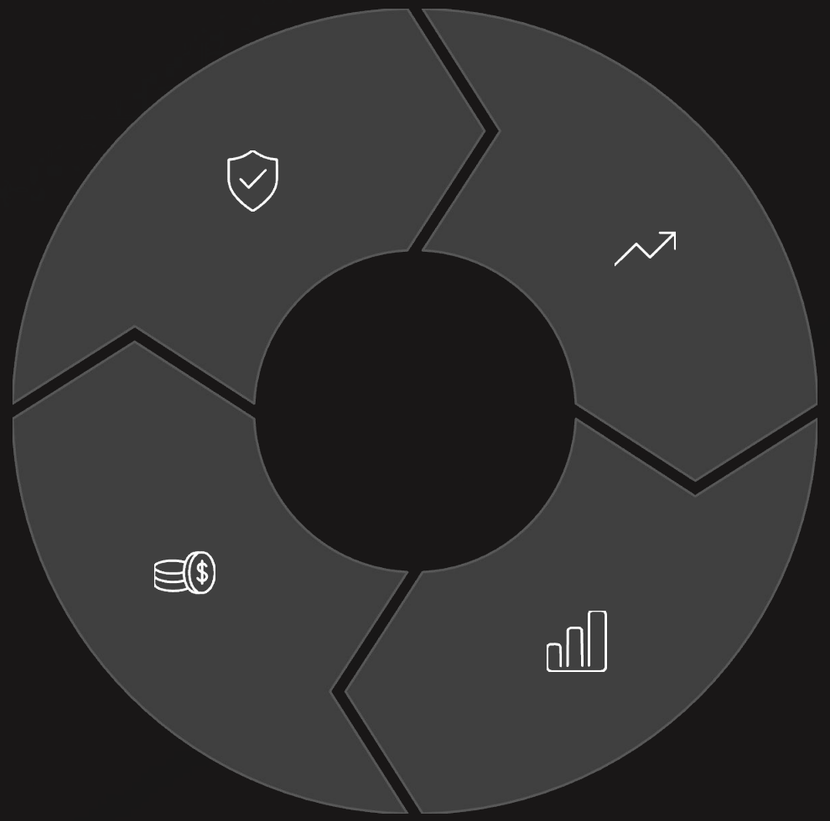
Targeted liquidity support creates a self-reinforcing growth loop — every additional unit of reserve depth compounds into higher ecosystem activity.

Deeper Reserves

Higher redemption confidence for users

More Deposits

Confidence drives inflows and capital reuse



More Fees On-Chain

TVL + volume + fees — all fully attributable

More Perp Trading

Greater capital enables larger, more frequent positions

Made with GAMMA

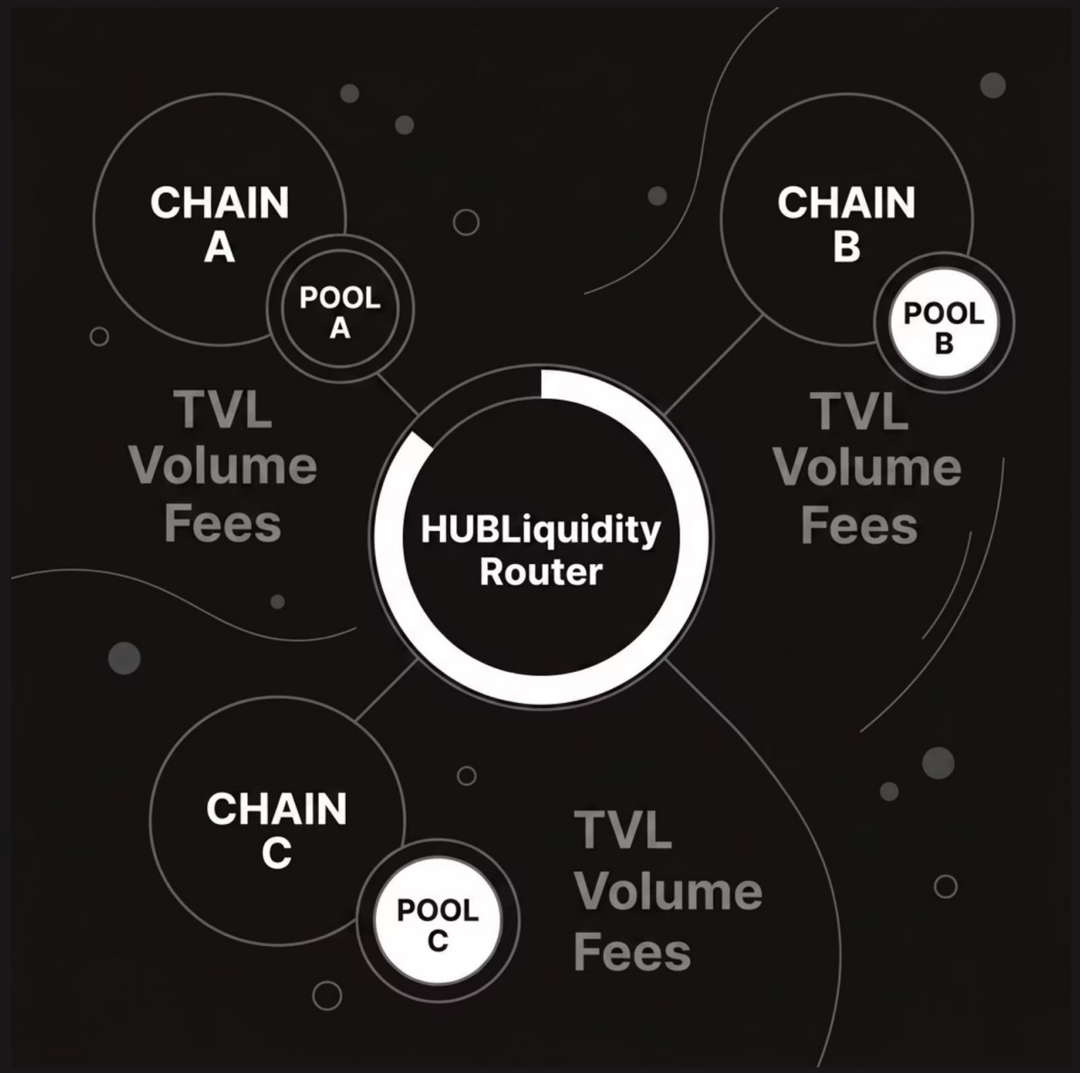
Liquidity Routing & Ring-Fenced Attribution

Each chain receives its own pool, attribution model, and KPIs

Deployment instances are chain-specific. Liquidity is ring-fenced per chain, with capital routed proportionally to the level of support provided. There is no cross-chain dilution of attribution.

Independent KPI tracking per chain:

- **TVL**
- **Volume**
- **Fees**



Made with GAMMA

Pilot Design: 90–180 Day Deployment

1

Bootstrap

Seed vault reserves, initialise shared perp pool, deploy initial basket allocations. Capital enters the system as infrastructure — not grants.

2

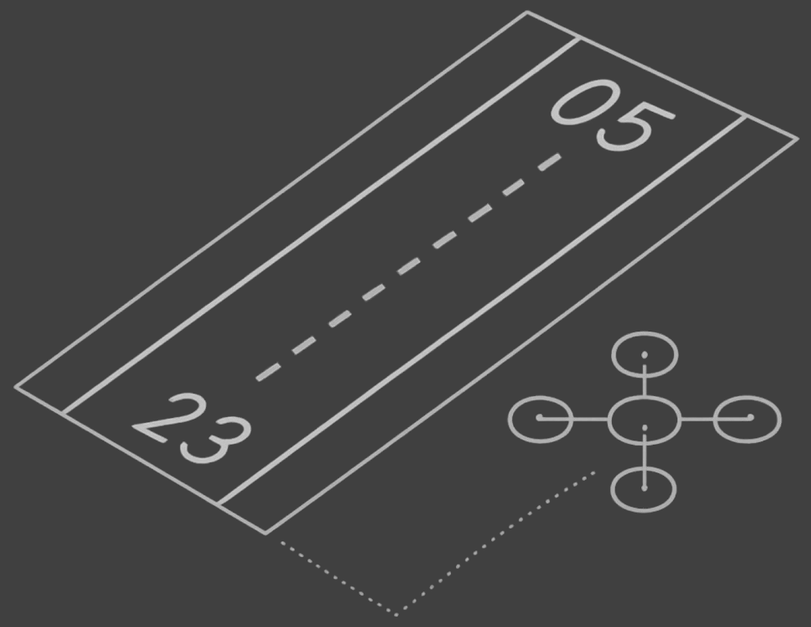
Expansion

Reserve top-ups and non-dilutive pool deposits scale liquidity depth as usage data validates throughput assumptions.

3

Optimisation

KPI attribution reviewed against TVL, volume, and fee targets. Deployment parameters adjusted for sustained capital efficiency.



A controlled liquidity pilot programme that lets a chain buy growth with attribution.

Chain-Agnostic, Chain-Specific

Deployable on any chain. Liquidity is ring-fenced and attributed to the supporting chain — no cross-chain dilution.

Structured Vault Infrastructure

Basket vaults + shared perp liquidity layer. Not a token, not a retail product — institutional-grade infrastructure.

Measurable Ecosystem Outcomes

Every unit of support is traceable to TVL, volume, and fee generation. This is productive liquidity, not passive subsidy.

Made with GAMMA

Next Steps: For Chains

Begin the Pilot Conversation

We are seeking chain partners and grant committees ready to deploy structured liquidity with full attribution. The pilot is designed to be low-friction, non-dilutive, and immediately measurable.

01

Scoping Call

Define chain-specific KPI targets and deployment parameters.

02

Term Sheet

Agree on capital commitment, pilot duration, and attribution methodology.

03

Bootstrap Deployment

Capital enters the system. KPI tracking begins from day one.

IndexFlow

$FLOW

Made with GAMMA

$FLOW governs concrete control points in the system

The token is not required for initial usage. It becomes the coordination layer after the system is working.

It governs concrete operating levers:

Basket Support

Which baskets receive protocol support

Manager Admission

Which managers are admitted or prioritised

Chain Expansion

Which chains receive liquidity expansion

Incentive Direction

How incentive budgets are directed

Protocol-Owned Liquidity

When protocol-owned liquidity is increased

Asset/Oracle Admission

Which assets are allowed on the platform given reliable price feeds

Made with GAMMA

Seed liquidity first, emit later!

Token supply is allocated for long-term coordination, but issuance is disciplined and milestone-driven.

Team & Contributors

15%

12-month cliff, then 36-month linear vest

Private Investors

10%

12-month lock, then 24-month linear vest

Ecosystem Growth

25%

Gradual 48-month release

Liquidity

30%

Partially available at launch, remainder phased in

Made with GAMMA

Liquidity strategy starts at the protocol level

The protocol's first problem is NOT token trading & secondary markets— it is making structured exposure redeemable and scalable.

Reserve liquidity comes first, execution liquidity comes second, token market liquidity comes later.

1

Token Market Liquidity

Supports later price discovery and tradability. Secondary to proving protocol-level liquidity first.

2

Execution Liquidity

Supports trading capacity, rebalancing, and exits. Determines system throughput.

3

Reserve Liquidity

Supports redemptions. Protects user trust in NAV-to-cash conversion. **Foundation of the system.**

Made with GAMMA

Build the system, make it compliant, make liquidity credible

Raising a private round for **$1M at $20M FDV**

$300K

Development: Tech + Compliance + Audit

Development and legal/compliance work establish the foundation.

$250K

Liquidity Reserve

Protocol liquidity and reserve support are put in place.

$150K

Mainnet: Product + Token

Token market formation and launch support activate the market.

$100K

Community Growth

GTM and ecosystem incentives drive adoption and expansion.

Made with GAMMA

Appendix

Made with GAMMA

How do we make it compliant?

Made with GAMMA

Magicians behind the curtains:

Made with GAMMA

Durable liquidity creates durable revenue

Liquidity Discipline

Separate Reserves

Protocol reserves are managed separately from token market liquidity.

Operating Metrics

Redemption support and trading depth are tracked continuously.

Expansion Tools

Incentives expand liquidity; they do not replace it.

Control Limits

Launch caps, routing limits, and emergency controls stay in place.

Business Model

Revenue Scenarios

Scenario	TVL	Ann. Volume	Ann. Revenue
Early Network	$5M	$50M	$130K
Scaled Pilot	$15M	$150M	$390K
Multichain Scale	$40M	$560M	$1.136M

The protocol treats liquidity like infrastructure, and monetises both supported assets and supported activity.

Recurring Revenue

Management fees on AUM — 2% basket management fee

Activity-Based Revenue

Trading fees across the shared liquidity layer — 10 bps rate, protocol retains 60% of gross fees

Upside Revenue

Performance fees — excluded from base case

Strategic Revenue

Manager access / basket launch economics over time

Made with GAMMA

F***ix fragmented products

This is not just a better wrapper — it is a better liquidity architecture.

	Isolated Vaults	Token LP Bootstraps	Pure Perp Venues	Passive Wrappers	Our Model
Capital Efficiency	Low	Medium	Medium	Low	**High — shared engine**
Redemption Quality	Fragile	Fragile	Partial	Weak	**Reserve-backed**
Market Depth	Shallow	Mercenary	Deep	Shallow	**Coordinated**
Manager Extensibility	None	Limited	None	None	**Governed admission**
Liquidity Durability	Low	Low	Medium	Low	**Milestone-driven**
Governance over Growth	None	None	Limited	None	**Token-coordinated**

Made with GAMMA

Where we sit in the market

Market Archetypes

Pooled-Liquidity Perps

GMX, Jupiter, Gains — optimise for execution and pooled trading

Order Book / App-Chain Perps

Hyperliquid, dYdX — optimise for execution depth and throughput

Hybrid Venues

Drift, Vertex, Synthetix — optimise for hybrid breadth

IndexFlow

Structured exposure first.

Shared liquidity as the economic nucleus.

Governance focused on routing capital.

Competition:

- Gains Network
- Jupiter Perps
- GMX
- Sommelier
- Drift
